Nested Interval Behavior

Introduction

Nested Intervals provide a means of managing hierarchical data in a relational database by keying nodes in the tree using rational numbers.

The Nested Interval Behavior is an implementation of the encoding scheme presented in "Using Rational Numbers to Key Nested Sets"; Dan Hazel 19 June 2008.

(http://arxiv.org/PS_cache/arxiv/pdf/0806/0806.3115v1.pdf)

The key of a node is calculated from the key of the parent node in such a way that places every descendant of a node before the next sibling of the node.

A key feature of the encoding is a significantly reduced requirement for re-indexing of nodes; addition or deletion of a last child node requires no re-indexing, and deletion of any other node only requires re-indexing of sibling sub-trees.

Nested Interval encoding also provides inherent support for multiple trees.

Nested Interval Behavior

Compatibility

| | Yii | OS |
|------------------|-------|-----------|
| Tested with | 1.1.8 | Windows 7 |
| Should work with | 1.1.x | All |

Installation

1. Download Nested Interval Behavior from <http://www.yiiframework.com/extension/nested-interval/>
2. Open the zip file and extract the "nestedInterval" directory to the required place, e.g. under application.extensions.

Usage

Attach the Nested Interval Behavior to a model in the usual way. The figure below attaches the behavior with no additional configuration; see the API documentation for properties that can be configured.

```
class MyModel extends CActiveRecord {  
    ...  
    public function behaviors() {  
        return array(  
            'nestedInterval' => 'path.to.NestedIntervalBehavior'  
        );  
    }  
    ...  
}
```

Adding a node

When adding new data it must be added either as a child or sibling of an existing node, or as a root node; *CActiveRecord::save()* and *CActiveRecord::insert()* will throw exceptions if used to add data.

The following methods can be used to add data:

| | |
|-------------------------|--|
| addAsChild() | Adds the target (new) node as a child of the owner node |
| addAsChildOf() | Adds the current (new) node as a child of the target |
| addAsRoot() | Adds the current (new) node as a new root node |
| addAsSibling() | Adds the target (new) node as a sibling of the owner node |
| addAsSiblingOf() | Adds the current (new) node as a sibling of the target |
| after() | Adds the target (new) node as the next sibling of the owner node |
| append() | Adds the target (new) node as the last child of the owner node |

Nested Interval Behavior

| | |
|-----------------------|--|
| appendTo() | Adds the current (new) node as the last child of the target node |
| before() | Adds the target (new) node as the previous sibling of the owner node |
| first() | Adds the target (new) node as the first sibling of the owner node |
| insertAfter() | Adds the current (new) node as the next sibling of the target node |
| insertBefore() | Adds the current (new) node as the previous sibling of the target node |
| insertFirst() | Adds the current (new) node as the first sibling of the target node |
| insertLast() | Adds the current (new) node as the last sibling of the target node |
| last() | Adds the target (new) node as the last sibling of the owner node |
| prepend() | Adds the target (new) node as the first child of the owner node |
| prependTo() | Adds the current (new) node as the first child of the target node |

Deleting Nodes

Deletion of data must be done using one of the methods below; using *CActiveRecord::delete()* will throw an exception.

The following methods can be used to delete data:

| | |
|----------------------------|--|
| deleteDescendants() | Deletes the descendants of the owner node |
| deleteNode() | Deletes the owner node and its descendants |

Retrieving Data

Data can be retrieved in a variety of ways.

Scopes

Nested Interval Behavior provides a number of scopes that can be used to retrieve data:

| | |
|-----------------------|---|
| ancestors() | Finds the ancestors of the owner node |
| child() | Finds a specific child of the owner node |
| children() | Finds the children of the owner node |
| descendants() | Finds the descendants of the owner node |
| firstChild() | Finds the first child of the owner node |
| firstSibling() | Finds the first sibling of the owner node |

Nested Interval Behavior

| | |
|--------------------------|---|
| lastChild() | Finds the last child of the owner node |
| lastSibling() | Finds the last sibling of the owner node |
| nextSibling() | Finds the next sibling of the owner node |
| parent() | Finds the parent of the owner node |
| previousSibling() | Finds a specific sibling of the owner node |
| root() | Finds a root node. If an index (1 based) is given, that root node is found, otherwise the root node of the owner node is found. |
| roots() | Finds all root nodes |
| sibling() | Finds a specific sibling of the owner node |
| siblings() | Finds the siblings of the owner node |

Getters

Each scope has an associated getter; these are wrappers for `$model->scope()->find[All]()` , e.g. `$model->getFirstChild()` to retrieve the first child of a node.

Properties

The getters also mean that most data can be accessed as properties of the owner node, e.g. `$model->firstChild` also retrieves the first child of a node. The exceptions are `NestedIntervalBehavior::getChild()` , `NestedIntervalBehavior::getRoot()` , and `NestedIntervalBehavior::getSibling()` as these require a number; accessing these as properties will return a node using the method's default value.

The following are equivalent and return the first child of a node; which to use is purely a matter of preference:

| | |
|-----------------|---|
| scope | <code>\$model->firstChild()->find();</code> |
| getter | <code>\$model->getFirstChild();</code> |
| property | <code>\$model->firstChild;</code> |

createDescendantTree() and *createAncestorPath()*

These methods make the children and the parent of a node available as related records of the node.

For example, `$model->createDescendantTree()` makes all the node's children available as related records, each child will have its children as related records, and so on. Similarly, `$model->createAncestorPath()` makes the node's parent available as a related record, the parent will have its parent as a related record, and so on the root.

Nested Interval Behavior

Node Information

There are a number of methods to obtain information about a node:

| | |
|-----------------------------|---|
| getAncestorCount() | Returns the number of ancestors of the owner node |
| getChildCount() | Returns the number of children of the owner node |
| getDescendantCount() | Returns the number of descendants of the owner node |
| getIsDeleted() | Returns a value indicating if the owner node has been deleted |
| getIsLeaf() | Returns a value indicating if the owner node is a leaf node, i.e. has no children |
| getIsRoot() | Returns a value indicating if the owner node is a root node |
| getLevel() | Returns the level of the owner node |
| getPosition() | Returns the position – sibling number – of the owner node |
| hasChildren() | Returns a value indicating if the owner node has children |
| isAncestorOf() | Returns a value indicating if the owner node is an ancestor of a node |
| isChildOf() | Returns a value indicating if the owner node is a child of a node |
| isDescendantOf() | Returns a value indicating if the owner node is a descendant of a node |
| isParentOf() | Returns a value indicating if the owner node is the parent of a node |
| isSiblingOf() | Returns a value indicating if the owner node is a sibling of a node |

getXXX() methods allow the value to be accessed as a property, e.g. *\$model->level* also returns the level of the node within the hierarchy.

Moving Nodes

There are a number of methods to move nodes and their descendants – moving a node always moves its descendants. Nodes can be moved within a tree or to another tree, and non-root nodes can be moved to become a root node. All move methods return the number of nodes moved.

Methods for moving nodes and their descendants are:

| | |
|-----------------------------|--|
| moveAfter() | Moves the owner node to become the next sibling of the target node |
| moveBefore() | Moves the owner node to become the previous sibling of the target node |
| moveToFirstChild() | Moves the owner node to become the first child of the target node |
| moveToFirstSibling() | Moves the owner node to become the first sibling of the target node |

Nested Interval Behavior

| | |
|----------------------------|--|
| moveToLastChild() | Moves the owner node to become the last child of the target node |
| moveToLastSibling() | Moves the owner node to become the last sibling of the target node |
| moveToNthChild() | Moves the owner node to become the nth child of the target node |
| moveToNthSibling() | Moves the owner node to become the nth sibling of the target node |
| moveToRoot() | Moves the owner node to become a new root node |

After being moved a node will be keyed to its new position. Therefore, for example, `$node->moveAfter($target); $prev = $node->previousSibling;` will result in `$target=== $prev`

NestedIntervalBehavior

| | |
|-------------|---|
| Inheritance | NestedIntervalBehavior » CActiveRecordBehavior » CBehavior » CComponent |
| Implements | IBehavior |

Public Properties

See [CActiveRecordBehavior](#) for inherited properties.

| Name | Type | Description |
|----------------------------|--------|---|
| childRelatedRecords | string | The name of child related records. Defaults to "childNodes". Only used by createDescendantTree(). |
| dv | string | The name of the attribute used to store the Denominator of the node key. Defaults to "dv" |
| nv | string | The name of the attribute used to store the Numerator of the node key. Defaults to "nv" |
| parentRelatedRecord | string | The name of the parent related record. Defaults to "parentNode". Only used by createAncestorPath(). |
| sdv | string | The name of the attribute used to store the Next Sibling Denominator of the node key. Defaults to "sdv" |
| snv | string | The name of the attribute used to store the Next Sibling Numerator of the node key. Defaults to "snv" |

Public Methods

See [CActiveRecordBehavior](#) for inherited methods.

| Name | Description |
|------|-------------|
|------|-------------|

Nested Interval Behavior

| Name | Description |
|-------------------------------|--|
| addAsChild() | Adds the target (new) node as a child of the owner node |
| addAsChildOf() | Adds the current (new) node as a child of the target |
| addAsRoot() | Adds the current (new) node as a new root node |
| addAsSibling() | Adds the target (new) node as a sibling of the owner node |
| addAsSiblingOf() | Adds the current (new) node as a sibling of the target |
| after() | Adds the target (new) node as the next sibling of the owner node |
| ancestors() | Named scope to find the ancestors of the owner node |
| append() | Adds the target (new) node as the last child of the owner node |
| appendTo() | Adds the current (new) node as the last child of the target node |
| before() | Adds the target (new) node as the previous sibling of the owner node |
| child() | Named scope to find a specific child of the owner node |
| children() | Named scope to find the children of the owner node |
| createAncestorPath() | Makes the parent of the owner node available as a related record of the node, the parent's parent as a related record of the parent, and so on. |
| createDescendantTree() | Makes the children of the owner node available as related records of the node, each of the children's children as related records of the children and so on. |
| deleteDescendants() | Deletes the descendants of the owner node |
| deleteNode() | Deletes the owner node and its descendants |
| descendants() | Named scope to find the descendants of the owner node |
| first() | Adds the target (new) node as the first sibling of the owner node |
| firstChild() | Named scope to find the first child of the owner node |
| firstSibling() | Named scope to find the first sibling of the owner node |
| getAncestors() | Returns the ancestors of the owner node |
| getAncestorCount() | Returns the number of ancestors of the owner node |
| getChild() | Returns a child of the owner node |
| getChildCount() | Returns the number of children of the owner node |

Nested Interval Behavior

| Name | Description |
|-----------------------------|---|
| getChildren() | Returns the children of the owner node |
| getDescendants() | Returns the descendants of the owner node |
| getDescendantCount() | Returns the number of descendants of the owner node |
| getFirstChild() | Returns the first child of the owner node |
| getFirstSibling() | Returns the first sibling of the owner node |
| getIsDeleted() | Returns a value indicating if the owner node has been deleted |
| getIsLeaf() | Returns a value indicating if the owner node is a leaf node, i.e. has no children |
| getIsRoot() | Returns a value indicating if the owner node is a root node |
| getLastChild() | Returns the last child of the owner node |
| getLastSibling() | Returns the last sibling of the owner node |
| getLevel() | Returns the level of the owner node |
| getNextSibling() | Returns the next sibling of the owner node |
| getParent() | Returns the parent of the owner node |
| getPosition() | Returns the position – sibling number – of the owner node |
| getPreviousSibling() | Returns the previous sibling of the owner node |
| getRoot() | Returns a specific root node. If an index (1 based) is given, that root node is returned, else the root node of the owner node is returned. |
| getSibling() | Returns a sibling of the owner node |
| getSiblingCount() | Returns the number of siblings of the owner node |
| getSiblings() | Returns the siblings of the owner node |
| hasChildren() | Returns a value indicating if the owner node has children |
| isAncestorOf() | Returns a value indicating if the owner node is an ancestor of a node |
| isChildOf() | Returns a value indicating if the owner node is a child of a node |
| isDescendantOf() | Returns a value indicating if the owner node is a descendant of a node |
| isLeaf() | Returns a value indicating if the owner node is a leaf node, i.e. has no children |

Nested Interval Behavior

| Name | Description |
|-----------------------------|--|
| isRoot() | Returns a value indicating if the owner node is a root node |
| isParentOf() | Returns a value indicating if the owner node is the parent of a node |
| isSiblingOf() | Returns a value indicating if the owner node is a sibling of a node |
| insertAfter() | Adds the current (new) node as the next sibling of the target node |
| insertBefore() | Adds the current (new) node as the previous sibling of the target node |
| insertFirst() | Adds the current (new) node as the first sibling of the target node |
| insertLast() | Adds the current (new) node as the last sibling of the target node |
| last() | Adds the target (new) node as the last sibling of the owner node |
| lastChild() | Named scope to find the last child of the owner node |
| lastSibling() | Named scope to find the last sibling of the owner node |
| moveAfter() | Moves the owner node to become the next sibling of the target node |
| moveBefore() | Moves the owner node to become the previous sibling of the target node |
| moveToFirstChild() | Moves the owner node to become the first child of the target node |
| moveToFirstSibling() | Moves the owner node to become the first sibling of the target node |
| moveToLastChild() | Moves the owner node to become the last child of the target node |
| moveToLastSibling() | Moves the owner node to become the last sibling of the target node |
| moveToNthChild() | Moves the owner node to become the nth child of the target node |
| moveToNthSibling() | Moves the owner node to become the nth sibling of the target node |
| moveToRoot() | Moves the owner node to become a new root node |
| nextSibling() | Named scope to find the next sibling of the owner node |
| parent() | Named scope to find the parent of the owner node |
| prepend() | Adds the target (new) node as the first child of the owner node |
| prependTo() | Adds the current (new) node as the first child of the target node |
| previousSibling() | Named scope to find a specific sibling of the owner node |
| root() | Finds a root node. If an index (1 based) is given, that root node is found, else the root node of the owner node is found. |

Nested Interval Behavior

| Name | Description |
|-------------------|--|
| roots() | Finds all root nodes |
| self() | Named scope to find the owner node. Used internally |
| sibling() | Named scope to find a specific sibling of the owner node |
| siblings() | Named scope to find the siblings of the owner node |

Events

| Name | Description |
|------------------------|---|
| beforeDelete () | Called before a node is deleted. Ensures that the node is being deleted by the behaviour. |
| beforeSave () | Called before a node is saved. Ensures that a new node is being saved by the behaviour. |

Property Details

childRelatedRecords

The name of child related records. Defaults to "childNodes". Only used by createDescendantTree().

dv

The name of the attribute used to store the Denominator of the node key. Defaults to "dv"

nv

The name of the attribute used to store the Numerator of the node key. Defaults to "nv"

parentRelatedRecords

The name of the parent related record. Defaults to "parentNode". Only used by createAncestorPath().

sdv

The name of the attribute used to store the Next Sibling Denominator of the node key. Defaults to "sdv"

snv

The name of the attribute used to store the Next Sibling Numerator of the node key. Defaults to "snv"

Method Details

addAsChild (\$target, \$n = 0, \$validate = true, \$attributes = null)

Adds the target node as a child of the owner node.

Nested Interval Behavior

Parameters:

| | |
|----------------------|--|
| <i>CActiveRecord</i> | <i>Parent node</i> |
| <i>integer</i> | <i>Position to add at: 1 = 1st child, 2 = 2nd child, n = nth child; 0 (default) = last child - this provides the best performance as it minimises reindexing</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was appended, FALSE if not

addAsChildOf (\$target, \$n = 0, \$validate = true, \$attributes = null)

Adds the owner node as a child of the target node.

Parameters:

| | |
|----------------------|--|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>integer</i> | <i>Position to add at: 1 = 1st child, 2 = 2nd child, n = nth child; 0 (default) = last child - this provides the best performance as it minimises reindexing</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was appended, FALSE if not

addAsRoot (\$validate = true, \$attributes = null)

Adds the owner node as a root node.

Parameters:

| | |
|----------------|---------------------------------------|
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was added, FALSE if not

addAsSibling (\$target, \$n = 0, \$validate = true, \$attributes = null)

Adds the target node as the nth sibling of the owner node.

Parameters:

| | |
|----------------------|--------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
|----------------------|--------------------|

Nested Interval Behavior

| | |
|----------------|--|
| <i>integer</i> | <i>Position to add at: 1 = 1st sibling, 2 = 2nd sibling, n = nth sibling; 0 (default) = last sibling - this provides the best performance as it minimises reindexing</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was inserted, FALSE if not

addAsSiblingOf (\$target, \$n = 0, \$validate = true, \$attributes = null)

Adds the owner node as the nth sibling of the target node.

Parameters:

| | |
|----------------------|--|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>integer</i> | <i>Position to add at: 1 = 1st sibling, 2 = 2nd sibling, n = nth sibling; 0 (default) = last sibling - this provides the best performance as it minimises reindexing</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was inserted, FALSE if not

after (\$target, \$validate = true, \$attributes = null)

Adds the target node as the next sibling of the owner node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was inserted, FALSE if not

See also:

insertAfter()

ancestors ()

Named scope to find the ancestors of the owner. The default order is from the parent up through the tree.

Nested Interval Behavior

Returns:

CActiveRecord The owner

append (\$target, \$validate = true, \$attributes = null)

Appends the target node to the owner node; the target node becomes the last child of the owner node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was appended, FALSE if not

appendTo (\$target, \$validate = true, \$attributes = null)

Appends the owner node to the target node; the owner node becomes the last child of the target node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was appended, FALSE if not

before (\$target, \$validate = true, \$attributes = null)

Adds the target node as the previous sibling of the owner node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was inserted, FALSE if not

See also:

insertBefore()

beforeDelete (\$event)

Handle the owner's 'beforeDelete' event.

Nested Interval Behavior

Parameters:

| | |
|---------------|------------------|
| <i>CEvent</i> | <i>The event</i> |
|---------------|------------------|

Returns:

boolean TRUE if the operation should continue, FALSE if not

Exceptions:

| | |
|--------------------------------|---|
| <i>NestedIntervalException</i> | <i>If CActiveRecord::delete() called directly on a node</i> |
|--------------------------------|---|

beforeSave (\$event)

Handle the owner's 'beforeSave' event.

Parameters:

| | |
|---------------|-------------------|
| <i>CEvent</i> | <i>The event.</i> |
|---------------|-------------------|

Returns:

boolean TRUE if the operation should continue, FALSE if not

Exceptions:

| | |
|--------------------------------|---|
| <i>NestedIntervalException</i> | <i>If CActiveRecord::save() called directly on a new node</i> |
|--------------------------------|---|

child (\$n = 1)

Named scope to find the nth child of a node.

Parameters:

| | |
|----------------|---|
| <i>integer</i> | <i>The child number to return; \$n==0 returns the last child. NULL will be returned if \$n>lastChild</i> |
|----------------|---|

Returns:

CActiveRecord The owner

children ()

Named scope to find the children of a node. The dataset is ordered in node key ascending order by default

Returns:

CActiveRecord The owner

createAncestorPath ()

Creates a path of ancestors under the owner node. After calling this method the owner will have its parent as related record, the parent will have its parent as related record, and so on.

Returns:

void

Nested Interval Behavior

createDescendantTree ()

Creates a tree of descendants under the owner node. After calling this method the owner will have its children as related records, each of the children will have their children as related records, and so on.

Returns:

void

deleteDescendants ()

Delete the descendants of a node

Returns:

integer the number of nodes deleted.

deleteNode ()

Delete a node and all its descendants

Returns:

integer the number of nodes deleted.

descendants ()

Named scope to find the descendants of the owner. The dataset is ordered in node key ascending order unless overridden.

Returns:

CActiveRecord The owner

first (\$target, \$validate = true, \$attributes = null)

Adds the target node as the first sibling of the owner node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Aattributes to save</i> |

Returns:

boolean TRUE if the node was inserted, FALSE if not

See also:

insertFirst()

firstChild ()

Named scope to find the first child of a node.

Returns:

CActiveRecord The owner

firstSibling ()

Named scope to find the first child of the parent of the owner node.

Nested Interval Behavior

Returns:

CActiveRecord The owner

getAncestorCount ()

Returns the number of ancestors of the owner

Returns:

integer The number of ancestors.

getAncestors ()

Returns the ancestors of the owner

Returns:

array The ancestors of the owner.

getChild (\$n)

Returns the nth child of the owner

Returns:

CActiveRecord The nth child of the owner. NULL if it does not exist.

getChildCount ()

Returns the number of children the owner has.

Returns:

integer The number of children of the owner.

getChildren ()

Returns the children of the owner

Returns:

array Children of the owner. An empty array is returned if the owner has no children, i.e. is a leaf node.

getDescendantCount ()

Returns the number of descendants the owner has.

Returns:

integer The number of descendants of the owner.

getDescendants ()

Returns the descendants of the owner.

Returns:

array The descendants of the owner.

getFirstChild ()

Returns the first child of the owner.

Returns:

CActiveRecord The first child of the owner; NULL if the owner has no children

getFirstSibling ()

Returns the first sibling of the owner.

Nested Interval Behavior

Returns:

CActiveRecord The first sibling of the owner

getIsDeleted ()

Returns a value indicating if this node has been deleted.

Returns:

boolean TRUE if this node has been deleted, FALSE if not

getIsLeaf ()

Returns a value indicating if the node is a leaf node, i.e. it has no children.

Returns:

boolean TRUE if the node is a leaf node; FALSE if not.

getIsRoot ()

Returns a value indicating if the node is a root node.

Returns:

boolean TRUE if the node is a root node; FALSE if not.

getLastChild ()

Returns the last child of the owner.

Returns:

CActiveRecord The last child of the owner; NULL if the owner has no children

getLastSibling ()

Returns the last sibling of the owner.

Returns:

CActiveRecord The last sibling of the owner

getLevel ()

Returns the level of the owner.

Returns:

integer The level of the owner.

getNextSibling ()

Returns the next sibling of the owner.

Returns:

CActiveRecord The next sibling of the owner; NULL if the owner is the last sibling

getParent ()

Returns the parent of the owner

Returns:

array The parent of the owner. Returns NULL if the owner is a root item.

getPosition ()

Returns the position of the owner relative to its siblings; i.e. 1=the 1st child/root, 2=the 2nd child/root, ..., n=nth child/root

Nested Interval Behavior

Returns:

integer The position of the owner relative to its siblings

getPreviousSibling ()

Returns the previous sibling of the owner.

Returns:

CActiveRecord The previous sibling of the owner; NULL if the owner is the first sibling

getRoot (\$n = 0)

Returns the nth root node. If \$n==0 the root node of the owner is returned.

Returns:

CActiveRecord The nth root, or root of the owner.

getSibling (\$n)

Returns the nth sibling of the owner

Returns:

CActiveRecord The nth sibling of the owner. NULL if it does not exist.

getSiblingCount (\$which = self::SIBLINGS_EX)

Returns the number of siblings the owner has

Parameters:

| | |
|----------------|---|
| <i>integer</i> | <i>Which siblings to count: + self::SIBLINGS_EX - all siblings excluding the owner (default) + self::SIBLINGS_ALL - all siblings including the owner - equivalent to the parent's children + self::SIBLINGS_AFTER - later siblings + self::SIBLINGS_BEFORE - earlier siblings</i> |
|----------------|---|

Returns:

integer The number of siblings of the owner.

getSiblings (\$which = self::SIBLINGS_EX)

Returns the siblings of the owner

Parameters:

| | |
|----------------|--|
| <i>integer</i> | <i>Which siblings to return: + self::SIBLINGS_EX - all siblings excluding the owner (default) + self::SIBLINGS_ALL - all siblings including the owner - equivalent to the parent's children + self::SIBLINGS_AFTER - later siblings + self::SIBLINGS_BEFORE - earlier siblings</i> |
|----------------|--|

Returns:

array The siblings of the owner.

hasChildren ()

Returns a value indicating if the node has children

Returns:

boolean TRUE if the node has children; FALSE if not.

Nested Interval Behavior

insertAfter (\$target, \$validate = true, \$attributes = null)

Adds the owner node as the next sibling of the target node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Aattributes to save</i> |

Returns:

boolean TRUE if the node was inserted, FALSE if not

insertBefore (\$target, \$validate = true, \$attributes = null)

Adds the owner node as the previous sibling of the target node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was inserted, FALSE if not

insertFirst (\$target, \$validate = true, \$attributes = null)

Adds the owner node as the first sibling of the target node

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was inserted, FALSE if not

insertLast (\$target, \$validate = true, \$attributes = null)

Adds the owner node as the last sibling of the target node

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Nested Interval Behavior

Returns:

boolean TRUE if the node was inserted, FALSE if not

isAncestorOf (\$node)

Returns a value indicating if the owner is an ancestor of the node

Returns:

boolean TRUE if the owner is an ancestor of the node; FALSE if not.

isChildOf (\$node)

Returns a value indicating if the owner is a child of the node

Returns:

boolean TRUE if the owner is a child of the node; FALSE if not.

isDescendantOf (\$node)

Returns a value indicating if the owner is a descendant of the node

Returns:

boolean TRUE if the owner is a descendant of the node; FALSE if not.

isLeaf ()

Returns a value indicating if the node is a leaf node, i.e. it has no children.

Returns:

boolean TRUE if the node is a leaf node; FALSE if not.

isParentOf (\$node)

Returns a value indicating if the owner is the parent of the node

Returns:

boolean TRUE if the owner is a descendant of the node; FALSE if not.

isRoot ()

Returns a value indicating if the node is a root node

Returns:

boolean TRUE if the node is a root node; FALSE if not.

isSiblingOf (\$node)

Returns a value indicating if the owner is a descendant of the node

Returns:

boolean TRUE if the owner is a descendant of the node; FALSE if not.

last (\$target, \$validate = true, \$attributes = null)

Adds the target node as the last sibling of the owner node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |

Nested Interval Behavior

| | |
|--------------|---------------------------|
| <i>array</i> | <i>Attributes to save</i> |
|--------------|---------------------------|

Returns:

boolean TRUE if the node was inserted, FALSE if not

See also:

insertLast()

lastChild ()

Named scope to find the last child of a node.

Returns:

CActiveRecord The owner

lastSibling ()

Named scope to find the last child of the parent of the owner node.

Returns:

CActiveRecord The owner

moveAfter (\$target)

Moves the owner node to become the next sibling of the target node

Parameters:

| | |
|----------------------|------------------------|
| <i>CActiveRecord</i> | <i>The target node</i> |
|----------------------|------------------------|

Returns:

integer The number of nodes moved

moveBefore (\$target)

Moves the owner node to become the previous sibling of the target node

Parameters:

| | |
|----------------------|------------------------|
| <i>CActiveRecord</i> | <i>The target node</i> |
|----------------------|------------------------|

Returns:

integer The number of nodes moved

moveToFirstChild (\$target)

Moves the owner node to become the first child of the target node

Parameters:

| | |
|----------------------|------------------------|
| <i>CActiveRecord</i> | <i>The target node</i> |
|----------------------|------------------------|

Returns:

integer The number of nodes moved

moveToFirstSibling (\$target)

Moves the owner node to become the first sibling of the target node

Nested Interval Behavior

Parameters:

| | |
|----------------------|------------------------|
| <i>CActiveRecord</i> | <i>The target node</i> |
|----------------------|------------------------|

Returns:

integer The number of nodes moved

moveToLastChild (\$target)

Moves the owner node to become the last child of the target node

Parameters:

| | |
|----------------------|------------------------|
| <i>CActiveRecord</i> | <i>The target node</i> |
|----------------------|------------------------|

Returns:

integer The number of nodes moved

moveToLastSibling (\$target)

Moves the owner node to become the last sibling of the target node

Parameters:

| | |
|----------------------|------------------------|
| <i>CActiveRecord</i> | <i>The target node</i> |
|----------------------|------------------------|

Returns:

integer The number of nodes moved

moveToNthChild (\$target, \$n)

Moves the owner node to become the nth child of the target node

Parameters:

| | |
|----------------------|--|
| <i>CActiveRecord</i> | <i>The target node</i> |
| <i>integer</i> | <i>Position to move to: 1 = 1st child, 2 = 2nd child, n = nth child; 0 (default) = last child - this provides the best performance as it minimises re-indexing</i> |

Returns:

integer The number of nodes moved

moveToNthSibling (\$target, \$n)

Moves the owner node to become the nth sibling of the target node

Parameters:

| | |
|----------------------|------------------------|
| <i>CActiveRecord</i> | <i>The target node</i> |
|----------------------|------------------------|

Returns:

integer The number of nodes moved

moveToRoot ()

Moves the owner node to become a new root node

Nested Interval Behavior

Returns:

integer The number of nodes moved

nextSibling ()

Named scope to find the next sibling of the owner

Returns:

CActiveRecord The owner

parent ()

Named scope to find the parent of the owner

Returns:

CActiveRecord The owner

parentQuadruple (\$node = null)

Returns an array with the node's quadruple

Parameters:

| | |
|----------------------|---|
| <i>CActiveRecord</i> | <i>The node to return the parent quadruple of. If NULL the owner's parent quadruple is returned</i> |
|----------------------|---|

Returns:

array The parent quadruple array(nv,dv,snv,sdv)

prepend (\$target, \$validate = true, \$attributes = null)

Prepends the target node to the owner node, i.e. the target node becomes the first child of the owner node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Returns:

boolean TRUE if the node was prepended, FALSE if not

prependTo (\$target, \$validate = true, \$attributes = null)

Prepends the owner node to the target node, i.e. the owner node becomes the first child of the target node.

Parameters:

| | |
|----------------------|---------------------------------------|
| <i>CActiveRecord</i> | <i>Target node</i> |
| <i>boolean</i> | <i>Whether to validate attributes</i> |
| <i>array</i> | <i>Attributes to save</i> |

Nested Interval Behavior

Returns:

boolean TRUE if the node was prepended, FALSE if not

previousSibling ()

Named scope to find the previous sibling of the owner.

Returns:

CActiveRecord The owner

root (\$n = 0)

Named scope to find a root node. If \$n is a +ve integer the \$nth root is found; anything else, the root node of the owner node is found

Parameters:

| | |
|----------------|-------------------------------------|
| <i>integer</i> | <i>The root node number to find</i> |
|----------------|-------------------------------------|

Returns:

CActiveRecord The owner

roots ()

Named scope to find root nodes.

Returns:

CActiveRecord The owner

self ()

Named scope to find the owner node. Merged using OR, so that (for example) *\$model->descendants()->self()->deleteAll()* deletes the owner node and its descendants

Returns:

CActiveRecord The owner

sibling (\$n = 1)

Named scope to find the nth child of the parent of the owner node.

Parameters:

| | |
|----------------|---|
| <i>integer</i> | <i>The sibling number to return; \$n==0 returns the last sibling. NULL will be returned if \$n>lastSibling</i> |
|----------------|---|

Returns:

CActiveRecord The owner

Nested Interval Behavior

siblings (\$which = self::SIBLINGS_EX)

Named scope to find the siblings of the owner. Can find all excluding (default), all including, earlier, or later siblings. By default the nodes are returned in sibling order

Parameters:

| | |
|----------------|--|
| <i>integer</i> | <i>Which siblings: + self::SIBLINGS_EX - all siblings excluding the owner (default) + self::SIBLINGS_ALL - all siblings including the owner - equivalent to the parent's children + self::SIBLINGS_AFTER - later siblings + self::SIBLINGS_BEFORE - earlier siblings</i> |
|----------------|--|

Returns:

CActiveRecord The owner

Database Schema

Below is the database schema used for unit testing. The Nested Interval Behavior requires the "nv", "dv", "snv", and "sdv" columns, though they can be renamed – see Property Details

```
CREATE TABLE `NestedInterval` (  
  `id`      int(11) NOT NULL AUTO_INCREMENT ,  
  `name`    varchar(255) NOT NULL COMMENT 'Node name' ,  
  `nv`      int(11) UNSIGNED NOT NULL COMMENT 'Node numerator' ,  
  `dv`      int(11) UNSIGNED NOT NULL COMMENT 'Node denominator' ,  
  `snv`     int(11) UNSIGNED NOT NULL COMMENT 'Next sibling numerator' ,  
  `sdv`     int(11) UNSIGNED NOT NULL COMMENT 'Next sibling denominator' ,  
  PRIMARY KEY (`id`)  
);
```
